Pluto is the ninth planet in the solar system. It is also the smallest and the coldest. Actually, Pluto is so freezing that its coldest temperature is minus 230°C.

It has one moon called Charon. Charon is nearly as big as Pluto itself and Pluto’s circumference is 7,171.76 km wide. Pluto’s moon Charon orbits round Pluto in six Earth days and nine Earth hours.

Pluto was discovered by Clyde Tombaugh in 1930. The problem is scientists are still trying to work out if Pluto actually is a planet. Because Pluto is so small, it could well be a moon of Neptune’s that has just started orbiting the Sun.
Robyn demonstrates a thorough knowledge and understanding of the content and the structure of an information report. A high level of competence is evident in the use of grammatical features, technical words and interesting compound and complex sentences. Most words are spelt accurately and the conclusion is very good. However, Robyn would benefit from including additional detail in the report.

Robyn’s response demonstrates characteristics of work typically produced by a student performing at a grade B standard.
